The instant invention involves the use of a	combination
of preparatory steps in conjunction with mass s	pectroscopy
and time-of-flight detection procedures to ma	ximize the
diversity of biopolymers which are verifiable	within a
particular sample. The cohort of biopolymers veri	fied within
such a sample is then viewed with reference to th	eir ability
to evidence at least one particular disease sta	te; thereby
enabling a diagnostician to gain the ability to c	characterize
either the presence or absence of said at least	one disease
state relative to recognition of the presence	and/or the
absence of said biopolymer.
